

Bloktherm Blokdry

Clear, solvent-based solution of organosilicon resins (silicones). It is intended for internal and external protection and enhancement of all types of mineral substrates, such as concrete, plaster, screed, asbestos cement, roof tiles, brick, gypsum, paving stones, etc. The impregnating agent deeply penetrates the substrate structure, significantly reducing the absorbency of floors while allowing the substrate to remain vapor-permeable. By penetrating the substrate, the impregnating agent reacts with the moisture present in it, creating a barrier against it.

Description

Application

Blokdry is designed for internal and external hydrophobic protection and enhancement of all types of mineral substrates, such as concrete, plaster, screed, asbestos cement, roof tiles, brick, gypsum, paving stones, etc. We recommend it primarily for new construction or substrates undergoing secondary regeneration, exposed to capillary rise of groundwater to floors or water penetration from precipitation.
